

Technical information manifolds and cables

Manifolds

This department is divided into flush-mounted and surface manifolds. The manifolds are differentiated on the basis of the used clamping technology (solder, screw, WAGO and LSA technology), manifold size and colour design.

While placing your orders please specify the colour scheme in addition to the number of pieces and Article No. For VdS manifolds, please use the lead seals included in the delivery scope (plastic plugs or VdS stickers) to protect the screws, and use the tension release options for fixing the cables.

Cables

While installing the cables, please ensure that the cable shield and the cable wires are not damaged. Damages can occur especially while fixing cables through drilled holes. Squeezing or crushing e.g., running down cables with hard rubber bands can also lead to defects.

The above mentioned manifolds should be used for cable extensions.
