

LINK presents latest developments at BAU 2019

BAU, the world's leading trade fair for architecture, materials and systems, is taking place once again in Munich from 14 to 19 January 2019. LINK will be presenting its latest developments and flexible solutions for security and building automation under the slogan "Customised Security Technology".

With three innovative divisions, LINK-PRO, LINK-OEM and LINK-ODM, LINK offers a wide variety of components, from high-quality standard ranges for specialists to custom-manufactured products – and all "Made in Germany".

High-performance miniature bolt contact

The exhibit at BAU 2019 will focus on products that combine high performance with compact design. One of the highlights is the new ERK 8501b electronic bolt contact with a miniature sensor. Thanks to its compact design, it can be used in places where conventional bolt contacts fall short. The ERK 8501b can easily be installed in even the smallest spaces, which makes it well suited for installation in modern tubular frame and folding glass doors, such as those found in shopping centres, train stations and airports. With VdS C certification, it also conforms to the highest security standards.

Ground-breaking data and energy transfer

The EKOM 22 contactless electronic transmitter also features a compact design and the highest VdS C security class. It is particularly useful for alarm glass – which typically has the VdS C certification – as it provides a connection from the glass to the system that provides the maximum security. It is suitable for installation in modern windows and door elements such as sliding doors but can also be used to secure wicket doors in shutter gates.

Stay for the presentation of the EKOM + prototype, an even more powerful solution for transferring energy and data to devices connected to door and window rebates.

Separable miniature door loops

Another highlight at BAU 2019 is the miniature door loop for concealed installation. The new M 13 35 can be installed diagonally, meaning it requires very little space. Doors and windows retain much of their stability, because the installation requires only minimal milling of the profiles. Tilt and turn windows also retain their full range of functions and can easily be unhinged simply by disconnecting the plug connector.

We look forward to welcoming you to hall B3, booth 541.
